General technical description

Cardan shafts are used in a drive train when a large shaft displacement or an extended distance between the drive and the driven components must be compensated. Depending on the arrangement of the drive train components, a nonuniform motion of the speed may result, and since cardan shafts exhibit some torsional flexibility, the mass of the prime mover and driven machine may induce a resonant system.

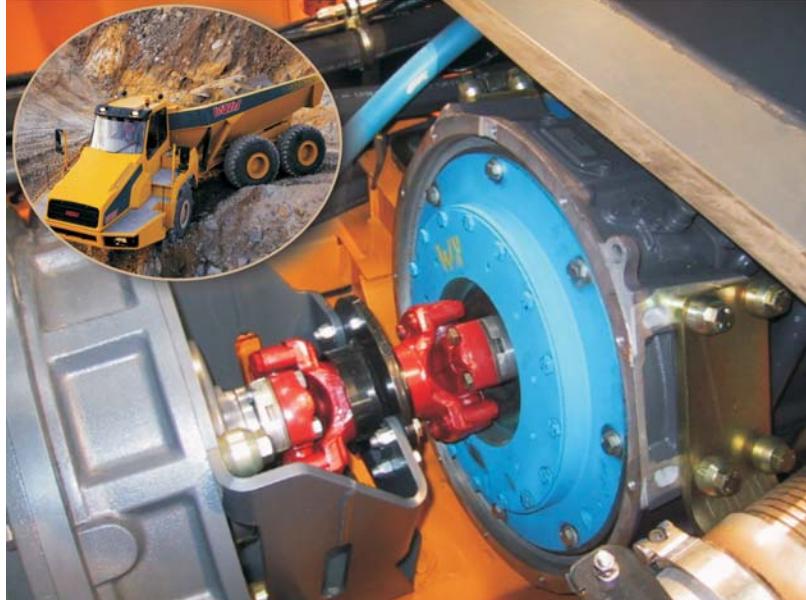

If the prime mover is an internal combustion engine, a highly flexible AC-VSK coupling is required to protect the drive train from dynamic overload. Highly flexible AC-VSK couplings are capable of shifting resonant ranges below the lowest operating speed and of reducing resonance-induced vibratory torques under reversed stresses to tolerable levels.

The highly flexible AC-VSK coupling is mounted on the engine flywheel, ahead of the drive train with drive shaft. The AC-VSK coupling contains its own axial and radial bearing to support the weight of the drive shaft and its reaction forces.

Coupling Sizes

The AC-VSK coupling series is available in nine standard sizes covering a torque range from 3,450 to 177,000 lb-in (390 to 20,000 Nm). REICH-KUPPLUNGEN has an extensive program of couplings to cover nearly every drive configuration. Customized solutions can be developed and manufactured even in small batches or as prototypes. Calculation programs are available for coupling selection and sizing.

- Please challenge us!

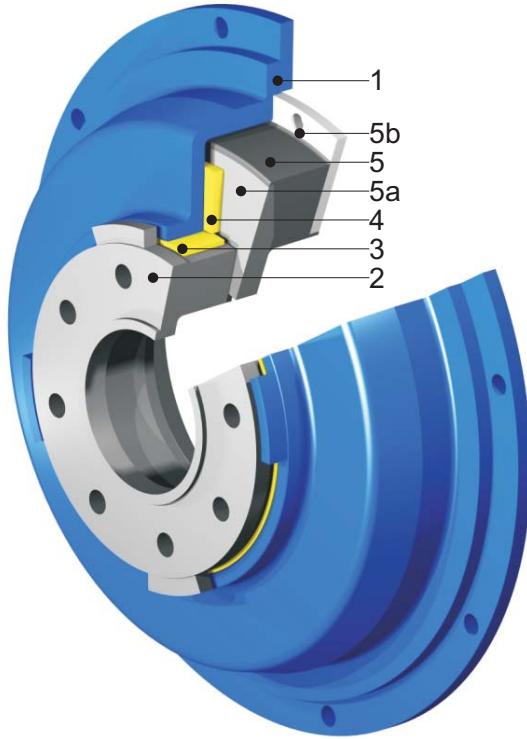

Application of the highly flexible ARCUSAFLEx®-VSK couplings

For use with combustion engines in conjunction with drive shafts for splitter gearboxes, torque converters, ship gearboxes, control gears and pump drives, for example in drives of construction equipment, excavators, cranes, marine propulsion, locomotives, pump installations and dump trucks.

Advantages of the ARCUSAFLEx®-VSK couplings:

- Linear torsional deflection characteristic
- Elements available in different torsional stiffnesses
- Enhanced damping capacity through frictional damping
- Maintenance-free coupling bearings
- Radial bearing close to the cardan joint
- A variety of designs for different cardan shaft configurations
- Many types with SAE connection dimensions or as specified
- Compact construction, the highly flexible element being protected by the housing
- Fail-safe device visible from the outside for ease of inspection

Design and function / Materials

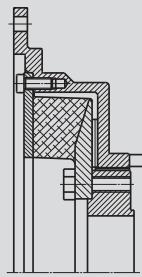

Coupling shown with fail-safe device

Item	Designation	Material
1	Coupling flange	Standard design spheroidal cast iron (GGG 40)
2	Drive shaft connection flange	Steel (yield strength min. 360 N/mm ² - 52,2 psi)
3	Radial bearing	Metal or plastic (maintenance-free)
4	Thrust bearing	Composite material (maintenance-free)
5	Flexible element	Rubber according to technical details
5a, 5b	Element discs	Steel

The highly flexible ARCUSAFLEx®-VSK couplings of the type AC-VSK ... F2 are specially designed for fitting to flywheels of internal combustion engines. The coupling flanges ① of the standard design, therefore, match engine flywheels with SAE connecting dimensions.

The highly flexible coupling element ⑤, is made of rubber bonded to steel discs and is mounted with an axial preload acting on the thrust bearing ④. The output flange ②, used to connect the cardan shaft is precisely located by means of the thrust bearing ④ and the radial bearing ③ ensuring excellent concentricity.

The dynamic performance of the coupling is improved by the pre-loaded rubber element and stabilizing effect of the support bearings providing enhanced damping capacity due to additional frictional damping.

Type AC-VSK....F2

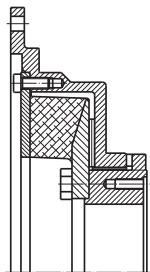

To connect an engine flywheel to a cardan shaft with metric DIN flange

$T_{KN} = 3,450 - 177,000 \text{ lb-in}$ ($T_{KN} = 390 - 20\,000 \text{ Nm}$)

Technical data Page 7

Dimensions Page 8

Available with or without fail-safe device

Type AC-VSK....F2

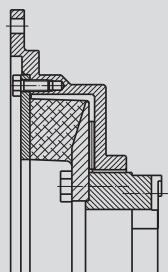

To connect an engine flywheel to a **SPICER** cardan shaft

$T_{KN} = 3,450 - 177,000 \text{ lb-in}$ ($T_{KN} = 390 - 20\,000 \text{ Nm}$)

Technical data Page 7

Dimensions Page 10

Available with or without fail-safe device

Type AC-VSK...F2

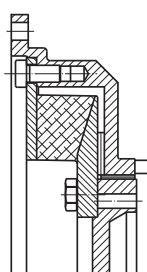

To connect an engine flywheel to a **MECHANICS** cardan shaft

$T_{KN} = 3,450 - 177,000 \text{ lb-in}$ ($T_{KN} = 390 - 20\,000 \text{ Nm}$)

Technical data Page 7

Dimensions Page 12

Available with or without fail-safe device

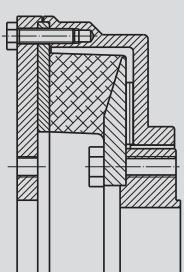

Type AC-VSK...F2.CV

To connect an engine flywheel to a constant velocity shaft

$T_{KN} = 3,450 - 177,000 \text{ lb-in}$ ($T_{KN} = 390 - 20\,000 \text{ Nm}$)

Technical data Page 7

Dimensions Page 14

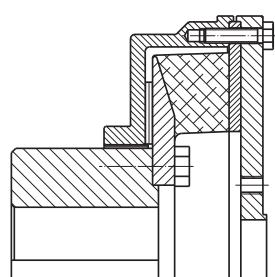

Type AC-VSK...F1

To connect a flange with cardan shaft connection to a cardan shaft

$T_{KN} = 3,450 - 177,000 \text{ lb-in}$ ($T_{KN} = 390 - 20\,000 \text{ Nm}$)

Technical data Page 7

Dimensions Page 16

Type AC-VSK...F1W

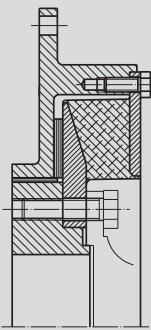

To connect a shaft to a cardan shaft

$T_{KN} = 3,450 - 177,000 \text{ lb-in}$ ($T_{KN} = 390 - 20\,000 \text{ Nm}$)

Technical data Page 7

Dimensions Page 17

Special types

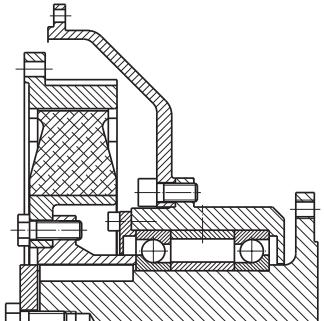

Short type AC-VSK...F2

Narrow width to connect an engine flywheel to a cardan shaft

$T_{KN} = 3,450 - 44,250 \text{ lb-in}$ ($T_{KN} = 390 - 20\,000 \text{ Nm}$)

Technical data Page 7

Dimension table available

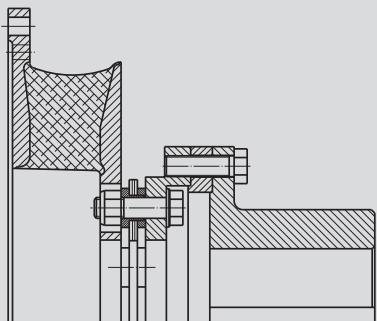

Type AC...F2 FG-GL Flange housing

Highly flexible ARCUSAFLLEX® flange coupling with integral shaft support to connect a cardan shaft having a large deflection angle, also available with integrated clutch.

A separate shaft bearing support attached to the engine housing keeps the crankshaft of the engine free from the additional stresses arising from cardan shaft fitment.

$T_{KN} = 4,425 - 177,000 \text{ lb-in}$ ($T_{KN} = 500 - 20\,000 \text{ Nm}$)

Technical data and dimension tables available on request

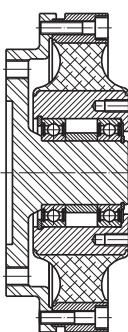

Type FD-VSK

Highly flexible coupling element AC-VSK in combination with a FlexDur disc pack.

For compensating large radial shaft displacements (e.g. in the case of flexibly mounted internal combustion engines). Axial compensation is ensured by the FlexDur disc pack.

For torques up to 247,800 lb-in (28 000 Nm)

Technical data and dimensions available on request

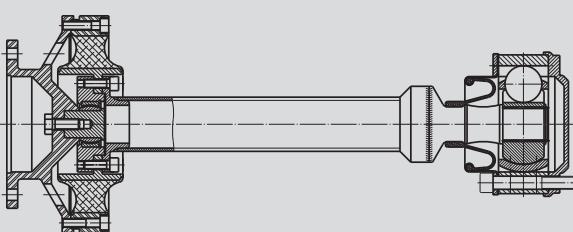

Type TOK

Highly flexible torsionally optimized coupling used in connection with a cardan shaft, constant velocity shaft, flange or splined shaft profile

$T_{KN} = 885 - 380,550 \text{ lb-in}$ ($T_{KN} = 100 - 43\,000 \text{ Nm}$)

Catalogue available on request

Special type TOK for test benches

Highly flexible torsionally optimized coupling for engine test benches

Available designs:

Integrated bearing with cardan shafts

Integrated bearing with constant velocity shafts

Double element coupling with / without telescopic unit

$T_{KN} = 885 - 265,500 \text{ lb-in}$ ($T_{KN} = 100 - 30\,000 \text{ Nm}$)

$n_{max} = 10\,000 \text{ rpm}$

Shore hardness of the rubber element version: EN = 50 °Shore A; WN = 55 °Shore A; NN = 65 °Shore A

1) The relative damping relates only to the elastomer. The frictional damping of the bearings has to be considered separately, depending on the type of operation.

2) Continuous vibratory torque under reversing stresses $\pm T_{KW}$ at $f = 10$ Hz, for other frequencies f_x apply $T_{KW} \cdot \sqrt{\frac{10}{f_x}}$

Coupling size selection

The selected coupling for internal combustion engine drives should be verified by a torsional vibration analysis which we will provide on request. A preliminary selection of the coupling can, however, be made based on the continuous engine power being transmitted.

Calculation of the **nominal drive torque T_{AN}** :

The **nominal torque capacity T_{KN}** of the coupling should be at least equal to the maximum engine torque T_{AN} at any operating temperature.

The **temperature factor S_t** allows for the decreasing load capacity of the coupling when affected by elevated ambient temperatures close to the coupling.

The torsional vibration analysis to verify the coupling selection should confirm that the permissible continuous vibratory torque under reversing stresses T_{KW} is at least equal to the highest vibratory torque under reversing stresses T_w encountered throughout the operating speed range whilst taking into account the temperature and frequency.

The **frequency factor S_f** allows for the frequency dependence of the permissible continuous vibratory torque under reversing stresses T_{KW} (10 Hz) when operating with a different frequency f_x .

$$T_{AN} [\text{lb-in}] = 63,000 \cdot \frac{P [\text{HP}]}{n [\text{rpm}]}$$

$$T_{KN} \geq T_{AN} \cdot S_t$$

Temp.	140 °F 60 °C	158 °F 70 °C	176 °F 80 °C	>176 °F >80 °C
S_t	1.25	1.4	1.6	on request

$$T_{KW} (10 \text{ Hz}) \geq T_w \cdot S_t \cdot S_f$$

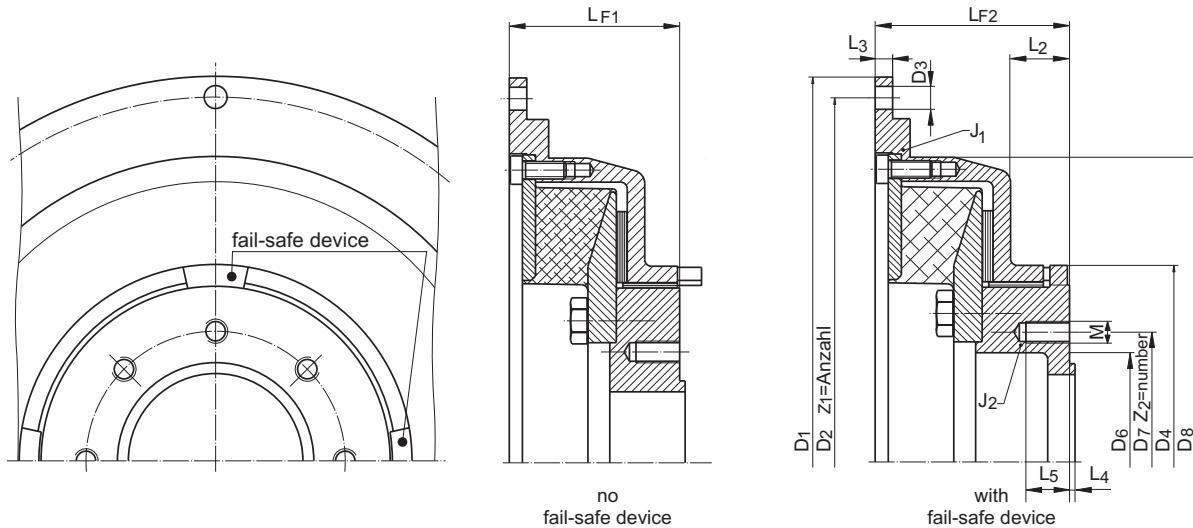

$$S_f = \sqrt{\frac{f_x}{10}}$$

Cardan shaft flange Ø _____

Assembly and maintenance instructions

General

The highly flexible ARCUSAFLEx®-AC-VSK coupling is well suited for installation with drive shafts because of its internal support by the radial and thrust bearings. The use of appropriate bearing materials makes the AC-VSK coupling maintenance-free.

The coupling element is suitable for ambient temperatures of -40 °F (-40 °C) to 176 °F (80 °C).

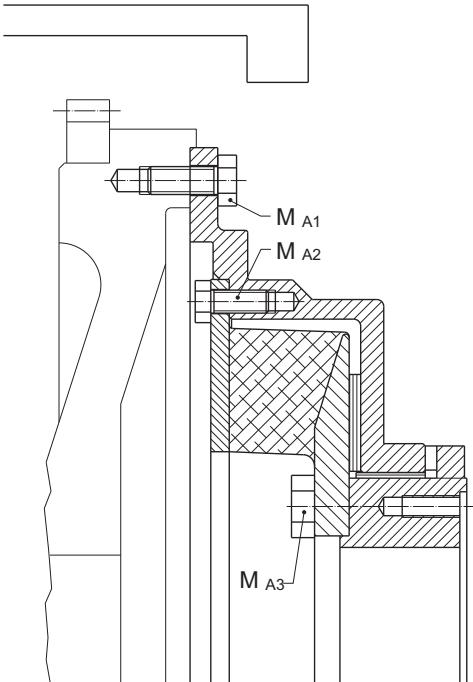

All couplings meet the balancing grade of G=16 for n=1500 rpm acc. to ISO 1940.

Assembly

Prior to the assembly, all parts of the coupling must be cleaned. All closely toleranced surfaces are protected with Tectyl preservative ex works. These surfaces must be cleaned with a suitable solvent prior to installation of the coupling. The solvent which is used for cleaning must not contact the rubber.

All bolted connections of the coupling should be tightened with a torque wrench and the correct bolt tightening torque must be checked. The prescribed bolt tightening torques must be precisely observed. As standard the values shown below are valid except when other values are specified. Values stated on the specific design drawing take precedence.

The coupling in its fully assembled condition is bolted to the engine flywheel and the full bolt tightening torque is applied. Then the flange of the drive shaft is bolted to the flange of the coupling.

Tightening torques for the bolted flange connection to the engine flywheel
(bolt grade 8.8, lightly oiled¹)

M_{A3} [Nm]	69	69	120	120	295	295	295	580	580

1) Values are reduced by 20% for bolts with additional lubrication.

Disassembly

First the drive shaft must be disconnected from the coupling. Then the coupling is unbolted from the engine flywheel and lifted out. To take the coupling apart, the bolt connections of the rubber elements must be released.

Safety precautions

It is the customer's and user's responsibility to observe the national and international safety rules and laws. Proper safety devices must be provided for the coupling to prevent accidental contact.

Check all bolted connections for the correct tightening torque and fit after a short running period preferably after a test run.

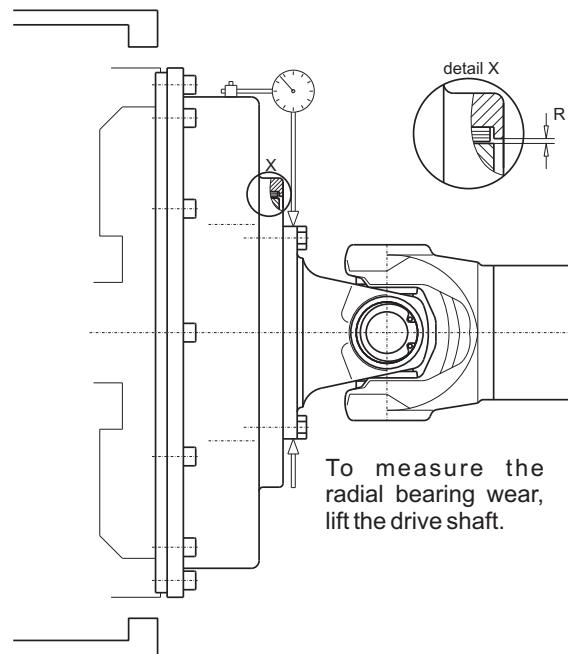

General maintenance and wear inspection

Within the established periodic maintenance and inspections of other parts of the installation, the coupling should regularly be visually inspected. Generally the internal bearing support in the coupling is maintenance-free. If there are any conspicuous symptoms a closer inspection is necessary.

The coupling must be disassembled according to the instructions. The visible outside and inside diameter of the rubber part of the removed coupling element has to be checked for possible cracks and separations. If there is any damage the coupling element must be replaced. At this time it is advisable to replace the bearings as well.

The thrust bearing (friction disc) and the radial bearing (bearing bushing) must be replaced if rough running is observed, or if a tilting clearance at the coupling is detectable. The thrust bearing (friction disc) must be replaced if there is a relative axial play between the drive shaft flange and the housing of the coupling. The radial bearing (bearing bushing) must be replaced if the radial wear R is exceeded. For this the radial relocation of the drive shaft flange to the coupling housing can be measured (see picture). The values shown in the table below serve as a guide. The running surfaces of the bearings must not be damaged. No reworking of the precision surfaces is advisable, if damaged these particular parts must be replaced.

During maintenance the coupling must be thoroughly cleaned.

Limits for wear of the friction disc and bearing bush

AC-VSK size	15	25	35	45	50	55	60	70	85
Thrust bearing friction disc thickness [in]	0.10	0.10	0.10	0.10	0.10	0.10	0.20	0.24	0.30
Thrust bearing friction disc thickness [mm]	2.5	2.5	2.5	2.5	2.5	2.5	5	6	7.5
Permissible axial wear [in]	0.024	0.024	0.024	0.028	0.028	0.028	0.028	0.031	0.031
Permissible axial wear [mm]	0.6	0.6	0.6	0.7	0.7	0.7	0.8	0.8	0.8
Radial bearing bush thickness [in]	0.16	0.16	0.20	0.20	0.20	0.20	0.20	0.20	0.20
Radial bearing bush thickness [mm]	4	4	5	5	5	5	5	5	5
Permissible radial wear R [in]*	0.012	0.012	0.012	0.012	0.012	0.012	0.031	0.031	0.031
Permissible radial wear R [mm]*	0.3	0.3	0.3	0.3	0.3	0.3	0.8	0.8	0.8

*) The wear of the bearing bush is equal to half of the measured radial wear R

During all operation phases the coupling has to run silently and vibration-free. Any deviation from this smooth behaviour during running indicates the need for closer inspection, repair or replacement.

In general a rebalancing of the coupling after replacing worn parts is not necessary. If rough running is observed after the repair, a further inspection is necessary and balancing may be required.
